DataDotDNA - Solution To Copper Cable Thefts.

Across the nation, the theft of copper cable is costing power companies millions of dollars each in losses, repairs and replacements. With the cost for copper metal increasing globally there is no end to this problem and in fact it may become worse.

Identification Technologies in conjunction with a major west-coast power company have tackled this problem head on by creating a security system that allows every inch of copper wire to be identifiable back to the lawful owner.

Using the DataDotDNA identification system, thousands of microchips laser etched with a company's name and telephone number can be sprayed into and around the outside of the cable. With so many identifiers applied, it is virtually impossible for thieves to remove the true owner's identity – a problem that was evident before stamping.

Applied with a specially designed durable non corrosive adhesive, DataDotDNA provides law enforcement with the correct tools to obtain capture and prosecuting of both thieves and receivers of stolen property.

Warning signs are posted around the perimeter fencing of each power station outlining that the copper wire has been identified and is traceable by law enforcement.

DataDotDNA is an economical and viable solution that is now available for all companies that suffer these types of losses.
